This document describes the configuration of the PAL Output module for the TDH 800 headend.

Physical installation of the module is described in the TDH 800 main unit installation guide.

System requirements

Computer minimum requirements	A computer meeting configuring the header	the following minimum requirements is required for nd.
	Operating system	Windows XP or above
	Browser Additional software	Windows Internet Explorer version 6.0 or equivalent Microsoft© Silverlight Runtime version 3.0 or above
Static IP address	A static address must	be used on the computer used to configure the headend.

Refer to the computer's operating software documentation for assistance on configuring static IP addresses.

Physical connection to headend

• Connect a Cat5e shielded cable or better between the computer's network port and the configuration port on the headend.

Service tool

- 1. Open a web browser window.
- 2. Enter 'http://192.168.0.100' in the web address field.
- 3. Press Enter.

- 4. Enter the password.
- 5. Press the Log in button.

Note:

Password = 'triax1234' when the service tool is opened for the first time.

The **Keep me logged in** checkbox overrides the system's automatic time out function, which is activated after 20 minute's inactivity.

Icons

Indicates whether the service tool is communicating correctly with the headend unit.GreenThe service tool and headend are communicating correctly.RedThe service tool and headend are NOT communicating correctly.

Indicates whether the headend unit is functioning correctly.

Overview

	Green Red	The headend unit is functioning correctly. The headend unit is functioning correctly.
Tabs	Accesses the va modules.	rious tabs used to configure the headend's input and output
	System	The service tool's 'home' window. Provides system overview information and configuration activation/control.
	Input	Tab for configuring input modules and services. Refer to input module manuals for information.
	CA Modules	Tab for configuring CI modules and CA cards. Refer to output module manuals for information.
	Output	Tab for configuring output modules and services. Refer to output module manuals for information.
	Network	Tab for defining customer specific settings that are network related, e.g. Network name, ID, and for defining HD/SD channel numbering.
	Channel List	Tab for viewing the channels being transmitted from the headend, as defined in the Input , CA Modules and Output tabs. Refer to input module manuals for information.
Misc. Buttons	Apply	Stores configuration settings on the SD card located in the headend.
		Red There are changes that have not been stored on the headend's SD card.
	Log In/Out	Grey All changes are stored on the headend's SD card.
	Luy π/υαι Δdmin -	Opens the settings for service tool window where language
		location, time zone, and initial IP addresses are specified.

Configuring CA modules

Configuring CA modules

Pre-requisites

The headend is running, the CA module has been placed in the output module, the output module is inserted in the headen, and the TDH Service Tool is connected to the headend.

See the TDH 800 Headend User Guide for information on inserting the output module into the TDH 800 headend.

Configuration

1. Select the **CA Modules** tab in the TDH Service Tool.

2. Press the **Setup** button for the CA module to be configured.

The **CA Module setup** window is displayed, initially containing default values.

- 3. Specify the speed of the CI card in the **Card speed** drop-down list.
- 4. Specify if a **constant bitrate** is to be used.
- 5. Select the service(s) that are to be descrambled (indicated by '\$') in the Service list area.
- 6. Select the **ER** checkbox to enable automatic error recovery for the service.

Signal transmission status through the CA module is constantly monitored when the **ER** checkbox is enabled, with the CA module being automatically reset in the event of data transmission failure. Note that signal transmission will be interrupted for all the services associated with the CA module when the error recovery monitoring prompts the resetting of the CA Module.

The **ER** checkbox should not be enabled for services where signals are not transmitted on a 24-hour basis.

7. Press the **Setup** button for the selected service.

Configuring CA modules

Filter options for FOX NEWS	22
Descramble non audio/video PIDs	
Descamble all audio PIDs	\checkmark
Cance	ок

The **Filter options** window is set by default to descramble all audio PIDs associated with the service.

8. Enable the **Descramble non audio/video PIDs** checkbox to descramble all PIDs associated with the service, that are neither audio, or video related.

Descramble non audio/video PIDs	lter opt	ions for FOX NEWS		8
Descamble all audio PIDs	Descra	mble non audio/video P	IDs

			Cancel	ок

- 9. Disable the **Descramble all audio PIDs** checkbox to limit the number of audio PIDs to be descrambled to specific languages.
- 10. Select an audio PID to be descrambled.
- 11. Select (if required) additional audio PIDs.
- 12. Press the OK button.

Note that an additional language drop-down list is displayed each time a language

is selected.

13. Press the Submit button in the CA Module setup window.

The service(s) selected in now listed.

14. Press the Apply button.

The following confirmation is displayed.

Configuring CA modules

Resetting

It may be necessary to reset the CA module if it malfunctions.

1. Press the Setup button for the CA module to be reset.

2. Press the Reset CAM button.

3. Press the Yes button.

The CA module will be reset and service transmission through it will be temporally interrupted. The **ER** checkbox can alternatively be enabled to automatically reset CA modules, see above.

Modifying

- 1. Press the Setup button for the CA module to be modified.
- 2. Make the desired changes.
- 3. Press the **Submit** button.
- 4. Press the Apply button in the Configuration window.

1. Press the **Delete** button of the CA module to be removed. A confirmation popup is displayed.

2. Press **Yes** on the confirmation popup.

Deleting

Configuring COFDM output modules

Pre-requisites

The headend is running, the output module is in position, and the TDH Service Tool is connected to the headend.

See the TDH 800 Headend User Guide for information on inserting the output module into the TDH 800 headend.

Configuration

1. Select the **Output** tab in the TDH Service Tool.

2. Press the **Setup** button for the first output row.

	TRIAX		TDH Service Tool
	System Input CA Modules Output Netwo	rk Channel list	Apply Log out Admin.

- 4. Check the Select service/s checkbox for the required services.
- 5. (Optional) Specify an **Output SID** for the selected services.
- 6. (Optional) Specify a collective name (Mux) for the selected services in the Mux name field.
- 7. Press the **OK** button.

Note that services that have been selected will no longer be available in the TDX pool for other output modules.

From input module

1. Select 'Transparent' in the Select input drop-down list.

The Select input window is displayed.

Select input			22
Select input f	rom list		
Slot	HW installed	Frequency	Selected
⊿ Unit: 1 (1 item)		
1	DVB-S	10754 MHz (H)	✓
		6	
			Cancel OK

- 2. Check the Selected checkbox for the required input module.
- 3. Press the **OK** button.

All the services that are active on the input module will be transmitted via the output module.

Additional settings

- 1. Make (if required) additional configuration changes in the following fields/drop down lists in the configuration window:
 - RF level correction.
 - Modulation
 - FEC rate
 - Guard interval

• Transmission mode

Note:

The **Manual SDT version** checkbox is only used in special circumstances and it is recommended that it remains 'unchecked'.

2. Press the Submit button.

Validation

1. View the **Payload** bar, which graphically indicates the amount of data being transmitted in relation to the maximum permitted payload.

output does not exceed the maximum payload	
--	--

The output exceeds the maximum payload

2. View the status information at the bottom of the page to check that the output module is functioning correctly:

Field	Contents
Status	Whether the output module is enabled or disabled.
SW revision	Displays the software version of the output module. The software version displayed must be identical with that installed on the TDH 800 main unit and on all other input/output modules.
	Update the software for the entire TDH 800 headend (including input/output modules) if this is not the case.
Current payload	The current level of data being transmitted.
Max payload	The maximum level of data that can be transmitted.
	<u> </u>

The output module's first slot is now successfully configured, as shown below.

Syste Dutput 1	m Ir	X put CA Modules <u>Output</u> Net	work Channel list		Service Too
Slot	Output	HW installed	Channel	Status	
	1	COFDM	S35	ок	Setup Delete
	2	COFDM	\$36	Disabled	Setup
	3	COFDM	\$37	Disabled	Setup
	4	COFDM	\$38	Disabled	Setup

3. Press the **Apply** button.

The following confirmation is displayed.

The services selected are visible in the Channel list tab.

The remaining slots on the output module can now be configured in the same manner.

1. Press the Setup button for the output module to be modified.

- 2. Make the desired changes.
- 3. Press the Update button.
- 4. Press the Submit button.
- 5. Press the **Apply** button in the **Configuration** window

1. Press the **Delete** button of the output module to be removed.

A confirmation popup is displayed.

2. Press **Yes** to remove the output module.

The output module is displayed in red in the **Output** tab.

- 3. Turn off the headend.
- 4. Physically remove the output module from the headend.
- 5. Restart the headend.
- 6. Restart the service tool.

The output module will no longer be listed in the output module list.
