

TORQUE TOOL

F-Connector Tightening Tool

PCT-TT

Innovation for the Last Mile™

Tightens F-Connectors Right The First Time and Every Time

INNOVATIVE SOLUTION

The patent pending PCT Indoor Torque Tool (PCT-TT) has been developed to be used on all consumer electronics devices within the home. These devices (i.e. television monitors, settop boxes, modems, and MTA's) are typically terminated with "hand tightened" F-connectors. The female F-ports on such devices are not designed to withstand the excessive torque applied when using a wrench. Because of this, cable technicians and installers are advised not to wrench tighten connectors onto consumer electronics devices.

Whether used by a cable technician or cable subscriber, the torque value achieved is consistently ideal for terminations to all consumer electronics devices. Eight to ten inch-pounds of torque is significantly better (shielding performance, signal loss) than "finger tight", and will not result in damage to the female F-port. When coupled with a PCT torque retaining connector, the result is a connection that achieves, and permanently maintains, an optimal torque value.

ADVANCED FEATURES

- Tightens F-connectors to between 8 and 10 inch pounds of torque vs. finger tightening which typically produces just 1 to 3 in. lbs. of torque
- Consistent torque applied, regardless of the installer
- For use on all consumer electronics devices
- Infinite life cycle - tested and proven on thousands of rotations
- Glass filled nylon material "work hardens" with use- applied torque value does not decrease over time
- Reusable - not disposable
- Eliminates damage to television / modem / set-top ports caused by overly tightened connectors
- Prevents truck rolls caused by loose connectors
- Prevents signal loss, ingress / egress
- Great for Self Install Kits"!
